

Improved Design 430/440 Water Oscillator

The new design water oscillator assembly available for 430, 440, and Goss Community® style presses eliminates typical failures inherent to the old screw in oscillator design. This design has been used on all 430 and 440 units since mid-2006.

The new Manugraph DGM water oscillator give you the following benefits:

- Water oscillator roller is the same for 10&13 sides which means less spares required on hand.
- Roller spur gear mounted directly on roller shaft, not on the worm gear shaft as on old design. This gives less gear run out for longer gear life.
- Oscillator housing is rigidly supported by a locating diameter and four wide spaced bolts. Eliminates oscillator box “wobble” common on the old thread together design.
- Bolt together design will not loosen if your press is equipped with reverse. No pinning required for reverse as on old design.
